

SWAPNO MONDOL

Backend Engineer

Mirpur 2, Dhaka, Bangladesh · (+880) 01709112230 · swapno963@gmail.com
[LinkedIn](#) · [Portfolio](#) · [GitHub](#) · [Query Mind \(live\)](#)

SUMMARY

Backend Engineer specializing in Python, Django, FastAPI, and PostgreSQL, with experience building production APIs, data-intensive workflows, and containerized services deployed across AWS and on-premises infrastructure. Takes backend work from schema and business logic through CI/CD, Terraform, and production operation.

SKILLS

Core: Python, Django, Django REST Framework, FastAPI, PostgreSQL, REST APIs, authentication & authorization

Infrastructure: Docker, AWS (EC2, S3, ECR), Terraform, GitHub Actions, Linux, Nginx

Supporting: Redis, MongoDB, Go · LangGraph, MCP, sqlglot

Additional: React, Next.js, JavaScript

EXPERIENCE

Backend Developer — Meraki Innovation

Jan 2025 – Present

Mirpur 2, Bangladesh

- Designed and implemented a configurable production dashboard so operators can compose widgets from internal databases, external databases, and APIs instead of waiting on a new screen for every report.
- Implemented multi-engine data access across three databases, dynamic table generation, file uploads, and RBAC so widget data and replacement workflows stay inside each tenant's permissions.
- Designed document versioning with revision history so operational records stay auditable instead of being overwritten in place.
- Owned CI/CD and Terraform-based deploys across on-prem Windows Server and AWS so releases are repeatable rather than one-off copies.

Backend Developer — Cooking Station

Sep 2024 – Dec 2024

London, United Kingdom

- Maintained a live Django MVT product: bug fixes, new features, and a customized admin panel used in day-to-day operations.
- Redesigned parts of the database schema under changing production requirements, and integrated third-party APIs and cron jobs so operational work did not sit inside a single request/response cycle.

PROJECTS

Query Mind — Natural-language analytics over client databases | Django, LangGraph, PostgreSQL, sqlglot, MCP, SSE · [Live](#) · [GitHub](#)

- Django backend that answers questions in plain English by generating SQL against a connected client database. Query Mind's own PostgreSQL (users, orgs, connections, schema cache, history) stays separate from client business rows.
- Generate → validate → execute: sqlglot parses model-drafted SQL; only a single SELECT on allow-listed tables runs, under a read-only transaction with statement timeout, row cap, and a function denylist. Writes, empty allow-lists, and invalid SQL fail closed.
- MCP client for ServeEasy restaurant tools: scored matching, JWT-scoped catalogs, one confirmation retry on API writes. Chat is read-only for CUD. Encrypted org token for MCP reads; request header still wins. Status streams over SSE.

ShopVerse — Inventory-correct FastAPI services | FastAPI, PostgreSQL, MongoDB, Docker, JWT · [GitHub](#)

- Split user, product, inventory, and order into independently containerized FastAPI services. Inventory is the only PostgreSQL service (transactions, SELECT FOR UPDATE, history) so stock is not a naive integer update.
- JWT auth, transactional reserve/release/adjust, and pending orders when reservation fails. Lab-deployable backend, not a live storefront.

Education Institutions SaaS — API plus deploy path | Go/Gin, PostgreSQL, Redis/Asynq, Docker, Terraform, GitHub Actions, AWS · [Case study](#)

- Go APIs, PostgreSQL schema, auth middleware, and Asynq workers off the request path; VPC, subnets, security groups, and EC2 with Terraform.
- GitHub Actions format, vet, lint, tests, security scan, then SHA-tagged images to ECR. Compose on EC2 with Nginx and daily Postgres dumps to S3. Application source is private; the public repo is the infrastructure write-up.
