

SWAPNO MONDOL

DevOps Engineer

Mirpur 2, Dhaka, Bangladesh · (+880) 01709112230 · swapno963@gmail.com
[LinkedIn](#) · [Portfolio](#) · [GitHub](#) · [Query Mind](#) (live)

SUMMARY

DevOps Engineer who takes services from application code through Docker, Terraform, GitHub Actions, and production on AWS and on-premises Windows Server. Owns repeatable deploys, SHA-tagged images, and Linux/Nginx operation. Debugs live systems and automates with Python.

SKILLS

Infrastructure: Docker, Docker Compose, AWS (EC2, VPC, S3, ECR, IAM), Terraform, GitHub Actions, Linux, Nginx

Automation: Python, Git, cron / scheduled backups, production deploys

Application context: Django, FastAPI, Go, PostgreSQL

Additional: Redis, MongoDB, Kubernetes (familiar — not production)

EXPERIENCE

Backend Developer — Meraki Innovation

Jan 2025 – Present

Mirpur 2, Bangladesh

- Owned CI/CD and Terraform-based production deploys across on-prem Windows Server and AWS so releases are repeatable rather than one-off copies.
- Operated a live multi-tenant dashboard (multi-engine data access, file uploads, RBAC), including the release path those features depend on.
- Ran production Docker Compose on EC2 for a client Education SaaS: Nginx in front, health checks, and daily PostgreSQL dumps to S3.

Backend Developer — Cooking Station

Sep 2024 – Dec 2024

London, United Kingdom

- Maintained a live Django MVT product: bug fixes, new features, and a customized admin panel used in day-to-day operations.
- Integrated third-party APIs and cron jobs so operational work did not sit inside a single request/response cycle; redesigned parts of the database schema under changing production requirements.

PROJECTS

Education Institutions SaaS — production deploy path | Go/Gin, PostgreSQL, Redis/Asynq, Docker Compose, Terraform, GitHub Actions, AWS · [Case study](#)

- Provisioned VPC, subnets, security groups, and EC2 with Terraform. Compose on EC2 is the deploy unit (Nginx, API, workers, Postgres).
- GitHub Actions runs format, vet, lint, tests, and image vulnerability scanning, then publishes SHA-tagged images to ECR. A manual deploy workflow rolls the compose stack. Secrets via GitHub Actions and EC2 env files; IAM roles split for CI/CD vs infrastructure.
- Daily versioned Postgres dumps to S3 with a documented restore path. Observability beyond health checks is not shipped. Application source is private; the public repo is the infrastructure write-up.

ShopVerse — containerized FastAPI services | FastAPI, PostgreSQL, MongoDB, Docker · [GitHub](#)

- Split user, product, inventory, and order into independently containerized FastAPI services with Dockerfiles and Compose. Lab-deployable backend, not a live storefront.

Query Mind — natural-language analytics over client databases | Django, PostgreSQL · [Live](#) · [GitHub](#)

- Live Django service that generates validated, read-only SQL against a tenant-scoped client database, with an MCP client for restaurant tools. Included as a running product, not as a CI/CD case study.

ServeEasy — live restaurant product | Django, Docker · [Live](#)

- Operated the public restaurant ordering site and its MCP endpoint as a running Django service. Not used here as an infrastructure write-up.
